

MINOR PROJECT REPORT

ON

QUIZ-WHIZ

Submitted in partial fulfilment for the award of the degree of

BACHELOR OF COMPUTER APPLICATION

Submitted by: Isha Banka

Roll No.: 2211834040014

UNDER GUIDANCE OF

MRS. PARUL RASTOGI

MODERN GIRLS' COLLEGE OF PROFESSIONAL STUDIES

DEPARTMENT OF COMPUTER SCIENCE

UNIVERSITY OF LUCKNOW

SESSION: 2022-25

CERTIFICATE

This is to certify that project entitled **Quiz–Whiz** has been developed by Isha Banka under the supervision of Mrs. Parul Rastogi in partial fulfilment for the award of degree in Bachelor of Computer Applications (BCA) for the session 2023-2025.

(Signature)

Mrs. PARUL RASTOGI

Project Coordinator

Modern Girls' College of Professional Studies

Lucknow

ACKNOWLEDGEMENT

I would like to express my special thanks of gratitude to my supervisor **Mrs. Parul Rastogi**, as well as our faculty member **Mr. Neeraj Saxena** and **Mrs. Nilesh Khare** , who helped me in completing this project.

I am extremely grateful to my family and my friends who gave me valuable suggestions and guidance for completing my project. This cooperation and healthy criticism came handy and useful with them.

Hence, I would like to thank all the above mentioned people once again.

Thank You!

1. INTRODUCTION

The "Quiz Whiz" web app is designed to provide users with an interactive platform to participate in quizzes on various topics. The app allows users to test their knowledge, compete with others, and track their progress. The platform is accessible via web browsers, making it available across different devices without the need for installation.

2. OBJECTIVE

The main objectives of the "Quiz Whiz" web app are:

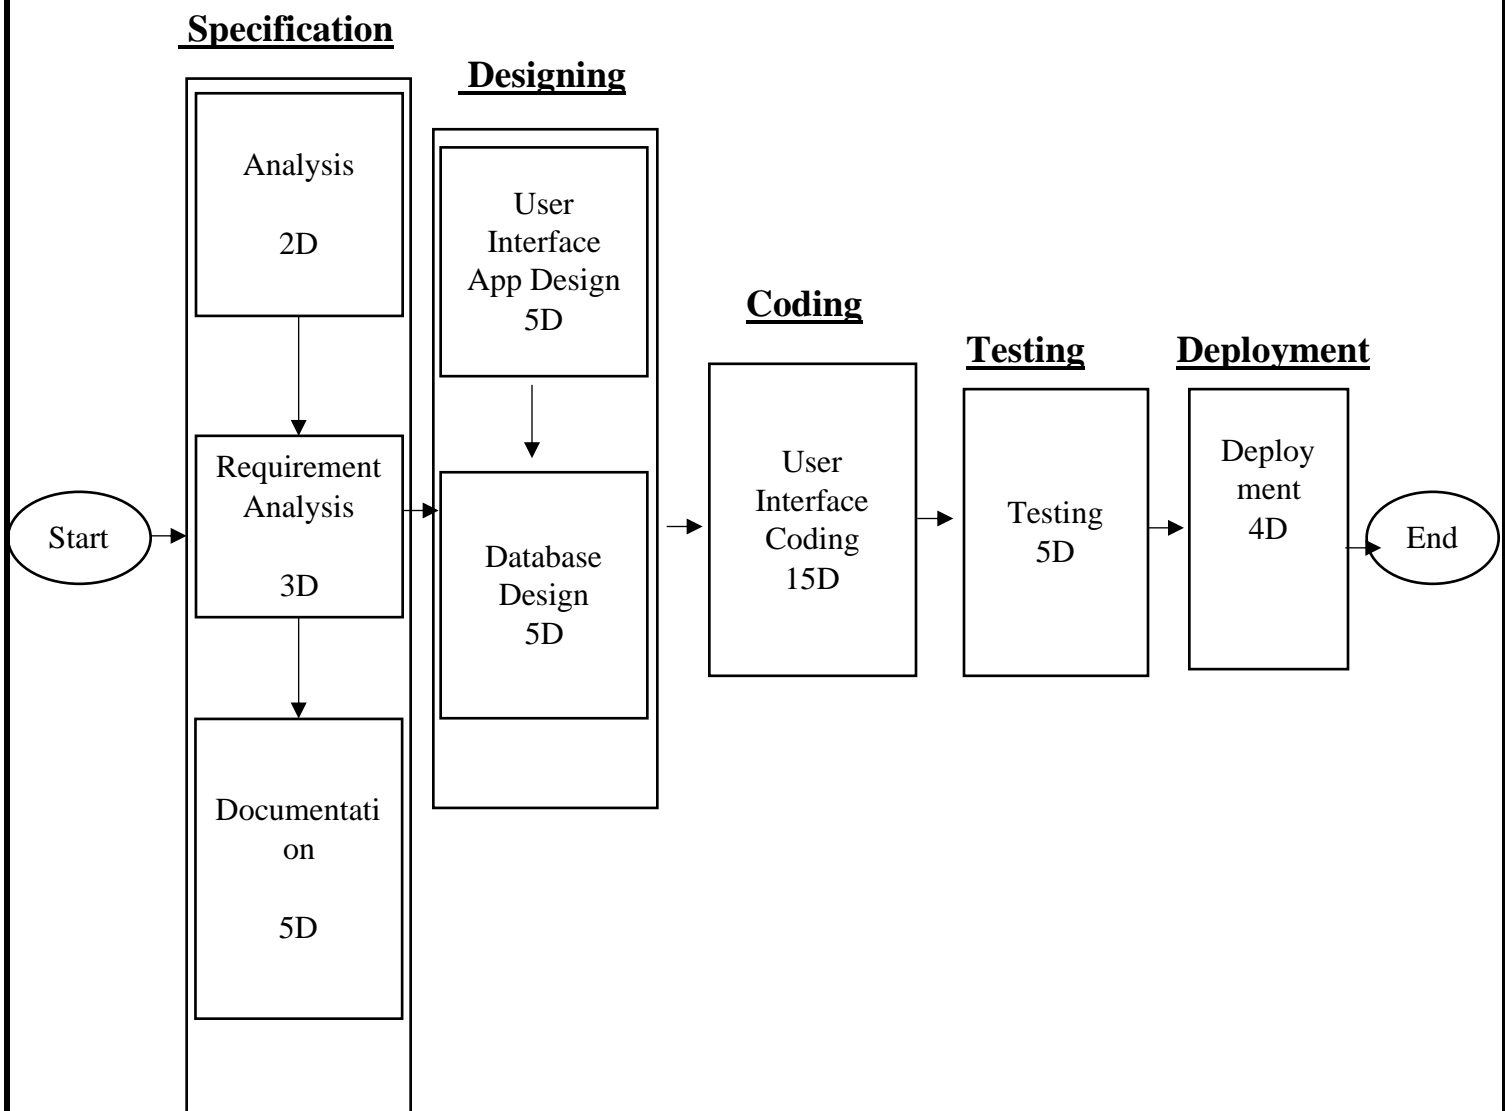

- To provide a user-friendly platform for quiz enthusiasts.
- To allow users to create and share quizzes.
- To offer real-time results and analytics to improve learning.
- To foster a community of learners through competitive quizzes.

3. Project Planning

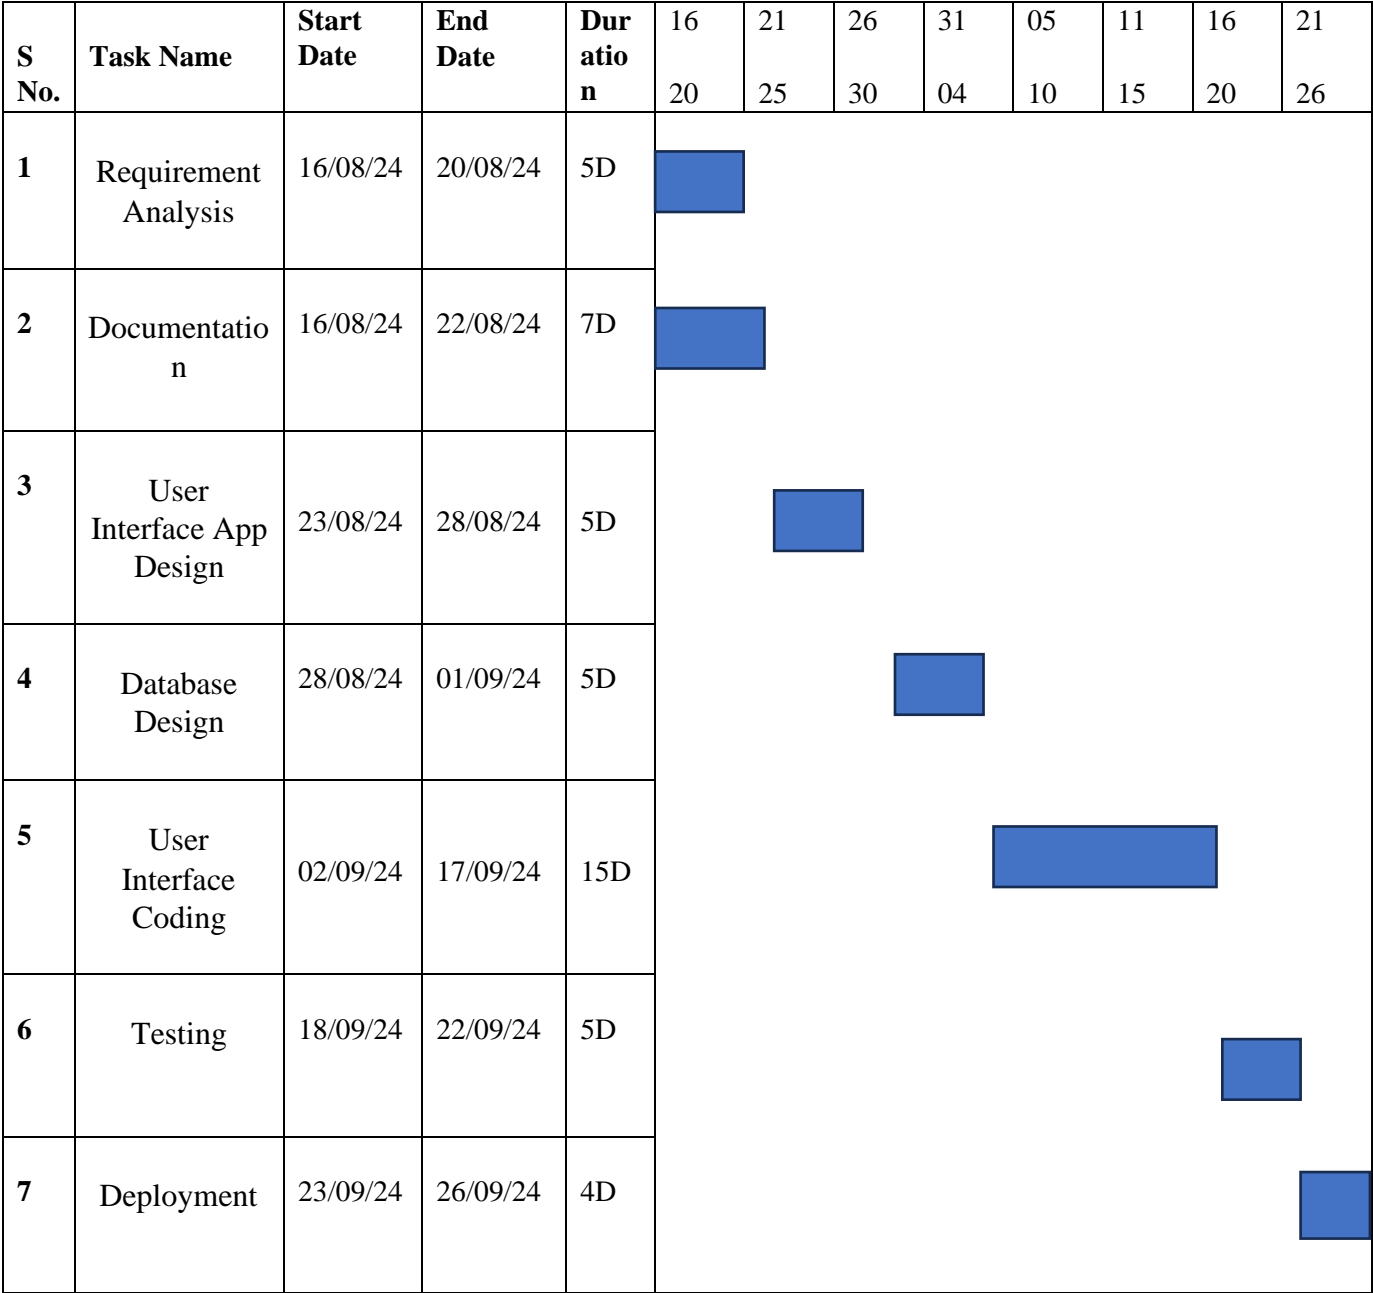

Software project planning is a task that is carried out in advance of the start of software creation. It is there to support software creation, but it doesn't actually entail any specific tasks that are directly related to it; rather, it consists of a number of procedures that make software production easier. Two important tools are used in project planning-

- Activity chart
- Gantt chart

3.1 ACTIVITY CHART

3.2 GANTT CHART

4. System Analysis

System Analysis “the process of studying a procedure or business to identify its goal and purposes and create systems and procedures that will efficiently achieve them”. Another view sees system analysis as work and interact to accomplish their purpose. The terms analysis and synthesis stems from Greek, meaning to “to take part” and “to put together”, respectively. These terms are used in many scientific disciplines, from mathematics and logic to economics and psychology, to denote similar investigative procedures.

Software Engineering Paradigm Applied-WATERFALL MODEL

System analysis “the process of studying a procedure or business to identify its goal and create systems and procedures that will efficiently achieve them”. Another view sees system analysis as work and interact to accomplish their purpose. The terms analysis and synthesis stems from Greek, meaning to “to take part” and “to put together”, respectively. These terms are used in many scientific disciplines, from mathematics and logic to economics and psychology, to denote similar investigative procedures. The system is defined as the “the procedure by which we break down an intellectual or substantial whole into parts,” while synthesis means “the procedure by which we combine separate elements or components to form a coherent whole.”

4.1 Sequential Phases in the WATERFALL MODEL

Requirement Gathering and Analysis- All possible requirements of the system to be developed are captured in this phase and documented in a requirement specification document.

System Design- The requirement specifications from first phase are studied in this phase and the system design is prepared. This system design helps in specifying hardware and system requirements and helps in defining the overall system architecture.

Implementation- With inputs from the system design, the system is first developed in small programs called units, which are integrated in the next phase. Each unit is developed and tested for its functionality, which is referred to as Unit Testing.

Integration and Testing- All the units developed in the implementation phase are integrated into a system after testing of each unit. Post integration the entire system is tested for any faults and failures.

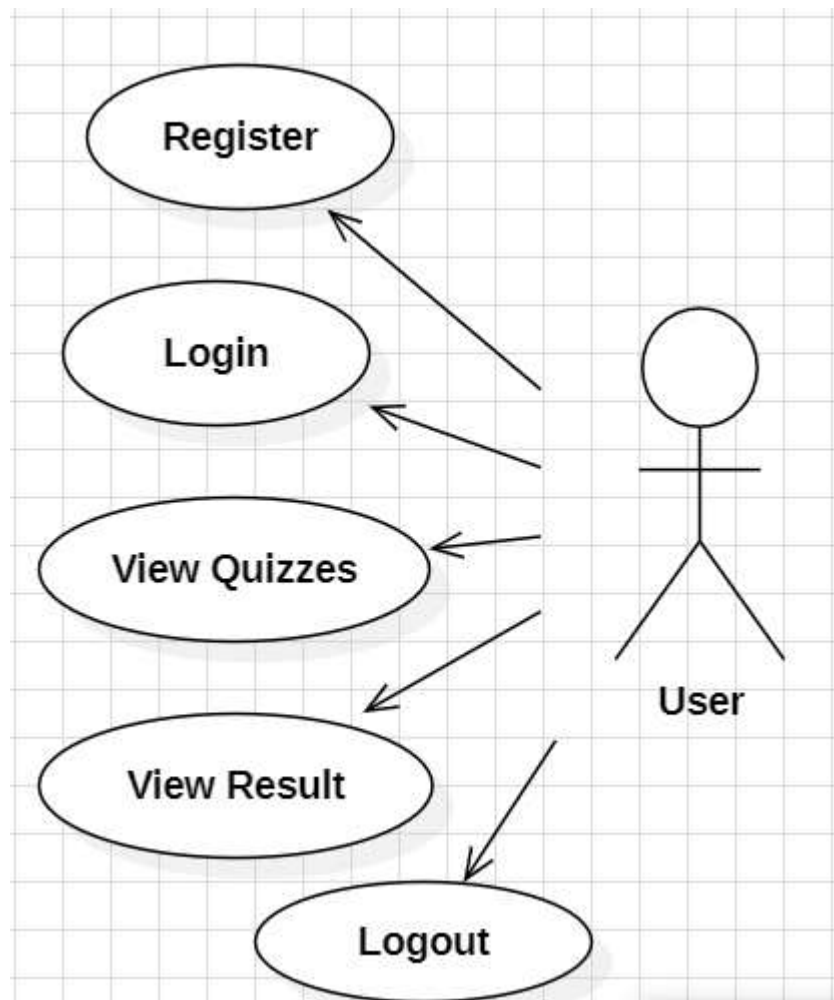

Deployment of System- Once the functional and non-functional testing is done ; the product is deployed in the customer environment or released into the market.

Maintenance- Maintenance is the most important phase of as oft ware lifecycle. The effort Spent in maintenance is the 60% of the total efforts to develop a full software.

7. Testing

The project involves:

- Data Collection and Cleaning: Gathering and preparing data from various sources.
- Data Analysis: Applying statistical and spatial analysis techniques.
- Visualization: Creating interactive visualizations.
- Web Application Development: Building a web application to display the analysis and visualizations.

Testing Techniques Given the nature of the project, the following testing techniques can be employed:

1. Unit Testing:
 - o Purpose: To test individual components of the system, such as data cleaning functions, statistical analysis modules, and visualization components.
 2. o Test Cases:
 - Test data cleaning functions with various input types (e.g., missing values, outliers, inconsistent formats).
 - Test statistical analysis functions with different datasets and expected outputs.
 - Test visualization components with different data inputs and visualization types.
 3. Integration Testing:
 - o Purpose: To test how different components of the system interact with each other.
 - o Test Cases:
 - Test the integration between data cleaning, analysis, and visualization components.
 - Test the integration of the web application with the backend components.
 4. System Testing:
 - o Purpose: To test the entire system as a whole.
 - o Test Cases:
 - Test the functionality of the web application, including user interface, data display, and interactivity.
 - Test the performance of the application under different load conditions.
 - Test the security of the application, including data privacy and access control.
- Test Suite Design A test suite is a collection of test cases designed to test a specific aspect of the system.

For this project, test suites can be designed for:

- Data Cleaning: Test cases to verify the accuracy and completeness of cleaned data.
- Data Analysis: Test cases to verify the correctness of statistical and spatial analysis results.
- Visualization: Test cases to verify the accuracy and clarity of visualizations.
- Web Application: Test cases to verify the functionality, performance, and security of the web application.

By employing a combination of these testing techniques and strategies, it is possible to ensure the quality, reliability, and security of the crime against women analysis proje

8. Conclusion

Quiz-Whiz is an interactive web app designed to make learning fun and engaging through dynamic quizzes. By fetching fresh questions from an API and managing state with Redux, it ensures a seamless user experience. The responsive design adapts to different screens, providing users with an enjoyable and intuitive interface. Robust error handling keeps users informed, enhancing reliability. With easy scalability, Quiz-Whiz can grow to include more quizzes and questions, making it a valuable educational tool for users of all ages.
